

## 1.4 Practices in geometry computations (part 4)

### 1.4.1 Mixed exercises 4

- Two circles of radius 2 are centered at  $(2, 0)$  and  $(0, 2)$ . What is the area of the intersection of the interiors of the two circles?
- Let  $ABCDEF$  and  $ABMNOP$  be two connected regular hexagons of side length 1. Compute the area of quadrilateral  $PNCE$ .
- In triangle  $ABC$ ,  $AB = BC = 1$  and  $AC = \sqrt{2}$ . Segment  $AB$  is a diameter of circle  $\omega$ . Semicircle  $\gamma$  has its center lying on side  $BC$ . Given that  $\gamma$  is tangent to  $\omega$  and  $\gamma$  passes through  $C$ , find the radius of  $\gamma$ .
- In rectangle  $ABCD$ ,  $AB = 6$ ,  $AD = 30$ , and  $G$  is the midpoint of side  $AD$ . Segment  $AB$  is extended 2 units beyond  $B$  to point  $E$ , and  $F$  is the intersection of segments  $ED$  and  $BC$ . What is the area of  $BFDG$ ?
- What is the radius of the largest circle that you can draw on graph paper that encloses  $n = 1$  lattice points? How about  $n = 2, 3, 4$ ?

### 1.4.2 Area, similarity, and Ceva (part 1)

- The sides of triangle  $ABC$  are  $AB = 13$ ,  $BC = 15$ , and  $CA = 14$ . Point  $P$  is located within the triangle so that triangle  $PAB$  has area 28, triangle  $PBC$  has area 35, and triangle  $PCA$  has area 21. If  $AP$  is extended until it meets  $BC$  at  $K$ , what is the length of  $BK$ ? If  $CP$  is extended until it meets  $AB$  at  $L$ , what is the length of  $AL$ ?
- Let  $A = (0, 0)$ ,  $B = (6, 0)$ , and  $C = (0, 6)$ . Point  $P$  lies inside the triangle.
  - Describe all points  $P$  such that the area of triangle  $ABP$  is equal to 9.
  - Describe all points  $P$  such that the area of triangle  $CAP$  is equal to 3.
  - Describe all points  $P$  such that the area of triangle  $BCP$  is equal to 6.
  - Find point  $P$  such that the area ratio between triangles  $ABP, BCP, CAP$  is  $[ABP] : [BCP] : [CAP] = 3 : 2 : 1$ . Find the respective ratios into which the line  $AP$  divides the side  $BC$ , the line  $BP$  divides the side  $CA$ , and the line  $CP$  divides the side  $AB$ .
- Let  $P$  be a point inside triangle  $ABC$ . Line  $AP$  intersects side  $BC$  in  $D$ , line  $BP$  intersects side  $CA$  in  $E$ , and line  $CP$  intersects side  $AB$  in  $F$ . Suppose that  $DP = 2$ ,  $PA = 5$ ,  $AF = 4$ ,  $FB = 3$ .
  - Construct point  $Q$  on line  $CF$  such that  $DQ \parallel AB$ . Find two pairs of similar triangles involving point  $Q$  and compute  $BD/CD$ .
  - Construct point  $R$  on line  $CF$  such that  $BR \parallel AD$ . Find two pairs of similar triangles involving point  $R$  and compute  $BD/CD$ .

9. Equilateral triangles  $ABE$ ,  $BCF$ ,  $CDG$ , and  $DAH$  are constructed outside the unit square  $ABCD$ . Eliza wants to stand inside octagon  $AEBFCGDH$  so that she can see every point in the octagon without being blocked by a side of the octagon. What is the area of the region in which she can stand?
10. In triangle  $ABC$ ,  $\angle C = 90^\circ$ ,  $AC = 10$ , and  $BC = 12$ . Semicircle  $\omega$ , with  $AC$  as its diameter, is erected outside of the triangle. Let  $P$  denote the midpoint of  $\omega$ . Segment  $BP$  cuts the whole region (bounded by sides  $BA$ ,  $BC$ , and  $\omega$ ) into two pieces. What is the positive difference between the areas of the two pieces?

## 1.9 Power-of-a-point theorem (part 2)

### 1.9.1 Power-of-a-point theorem (part 2)

1. In quadrilateral  $ABED$ , rays  $AD$  and  $BE$  meet at  $C$ . Suppose that  $\angle ABE = \angle CDE$ . Given that  $DA = 2$ ,  $CE = 4$ ,  $EB = 8$ , and  $CD = x$ . Find  $x$  by showing that  $x(x + 2) = 4 \cdot 12$ .

Note that  $x = -8$  is also a solution to  $x(x+2) = 4 \cdot 12$ . We are trying to find a configuration to explain this fact. Consider a self-intersecting quadrilateral  $ABED$  with sides  $AB$  and  $DE$  intersecting each other. We also consider the concept of *directed length*. In particular, assign one direction to  $CA$  and  $CD$ , and the opposite direction to  $DA$ ; that is,  $DA = -AD$ . Explain the rest of the details.

2. Let  $\omega$  be a circle with center  $O$  and radius  $R$ , and let  $X$  be a point in the plane that is outside of  $\omega$ . A line is drawn through  $X$ ; it intersects  $\omega$  at  $Y$  and  $Z$ . (If the line is tangent to the circle, then  $Y = Z$ ). Prove that  $XY \cdot XZ = XO^2 - R^2$  by either

- constructing the line  $XT$  that is tangent to  $\omega$  at  $T$ ; or
- constructing the line  $XO$ .

3. (Continuation) A similar result can be established when  $X$  is inside the circle. State and prove this result. Sometimes, this is called the *cross-chord theorem*.

4. Putting the results in the previous two problems together together, we have the following statement:

Let  $\omega$  be a circle with center  $O$  and radius  $R$ , and let  $X$  be a point in the plane. A line is drawn through  $X$ ; it intersects  $\omega$  at  $Y$  and  $Z$ . (If the line is tangent to the circle, then  $Y = Z$ ). Then the product  $XY \cdot XZ = XO^2 - R^2$  is constant (it does not depend on the line drawn), and it is called the *power* of  $X$  with respect to  $\omega$ . (The lengths are directed.)

- Given the circle  $\omega$  in the plane, determine the respective regions of all points in the plane that has positive, negative, zero power respect to  $\omega$ .
- Restate a simplified version of the statement by complete the following sentence.

Let  $\omega$  be a circle, and let  $X$  be a point in the plane. Two lines are drawn through  $X$ . If one line intersects  $\omega$  at  $Y$  and  $Z$  and the other line intersects  $\omega$  at  $P$  and  $Q$ , then \_\_\_\_\_.

- State the converse of the statement. Is the converse statement true? One needs to be a bit careful about configurations. (Hint:

This inverse together with the original statement is called the *Power-of-a-point theorem*.

5. Find all points  $Q$  in the coordinate plane such that there are exactly two circles passing through points  $P = (2, 3)$  and  $Q$ , both tangent to the  $x$ -axis.

### 1.9.2 Tangent circles

6. We are given two lines that are perpendicular to each other. A circular disc of radius 1 is placed so that it touches both of these lines. A larger circular disc of radius  $r$  is then placed so that it touches the smaller disc and both of these lines. Compute  $r$ .
7. Let  $XYZ$  be a triangle with  $\angle XYZ = 40^\circ$  and  $\angle YZX = 60^\circ$ . A circle  $\omega$ , centered at the point  $I$ , lies inside triangle  $XYZ$  and is tangent to all three sides of the triangle. Let  $A$  be the point of tangency of  $\omega$  with side  $YZ$ , and let ray  $XI$  intersect side  $YZ$  at  $B$ . Determine the measure of  $\angle AIB$ .
8. A square region  $ABCD$  is externally tangent to the circle with equation  $x^2 + y^2 = 1$  at the point  $(0, 1)$  on the side  $CD$ . Vertices  $A$  and  $B$  are on the circle with equation  $x^2 + y^2 = 4$ . What is the side length of this square?
9. Circles with centers  $A$  and  $B$  have radii 1 and 2, respectively. The distance between centers of circles is 6. Find the radius of a circle that is tangent to both of these circles and to the segment  $AB$ .
10. Circles of radii 5, 5 and 8 are mutually externally tangent to each other. A smaller circle with radius  $m/n$ , where  $m$  and  $n$  are relatively prime positive integers, is placed so that it is externally tangent to all of these circles. Find  $m + n$ .

## 2.4 Challenges in geometry calculations (part 2)

1. Let  $A, B, C, D$  be four points, arranged in clockwise order, on circle  $\omega$ . Segments  $AC$  and  $BD$  intersect at  $P$ . Given that  $AB = 3$ ,  $BP = 4$ ,  $PA = 5$ ,  $PC = 6$ , find the radius of the circle  $\omega$ .
2. The  $8 \times 18$  rectangle  $ABCD$  is cut into two congruent hexagons in such a way that the two hexagons can be repositioned without overlapping to form a square. What is the perimeter of the hexagon?
3. Let  $ABCD$  be a trapezoid with  $AB \parallel CD$  and  $CD = 2AB = 2AD$ . Suppose that  $BD = 6$  and  $BC = 4$ , find the area of the trapezoid.
4. Circle  $\omega$ , centered at  $I$ , is inscribed in quadrilateral  $ABCD$ . Given that  $AB = 4$ ,  $BC = 6$ ,  $DA = 3$ ,  $DB = 5$ . Find  $AI$ .
5. In triangle  $ABC$ ,  $AB = 4$  and  $AC = 5$ . Point  $D$  lies on side  $AB$  with  $AD = 3$ . Let  $X$  be a point on side  $AC$ . Segments  $BX$  and  $CD$  meet in  $P$ . Compute  $DP/PC$  and  $BP/PX$  for each of the following cases.
  - (a)  $AX = XC$
  - (b)  $\angle ABX = \angle XBC$

## 2.5 Geometry project 3: Folding, unfolding, and 3-D visions

1. The height of a cylindrical pole is 12 feet and its circumference is 2 feet. A rope is attached to a point on the circumference at the bottom of the pole. The rope is then wrapped tightly around the pole four times before it reaches a point on the top directly above the starting point at the bottom. What is the minimum number of feet in the length of the rope? Express your answer in simplest radical form.
2. A  $\theta$ -degree sector of a circle of radius  $r$  is folded to a right cone by aligning the two straight sides. Compute the volume of the cones.
  - (a)  $\theta = 180^\circ, r = 12$
  - (b)  $\theta = 216^\circ, r = 10$
  - (c)  $\theta = 288^\circ, r = 10$
3. Consider the paper rectangle  $ABCD$ . Point  $E$  lies on side  $AB$  and points  $F$  and  $G$  lie on side  $CD$ . Construct segments  $AG, GE, EF, FB$ . Given that  $AG = GE = EF = FB = AE = EB = FG = 5$ . One can fold this rectangular piece of paper along constructed segment to obtain a regular tetrahedron. What is the volume of the tetrahedron?
4. A cone-shaped mountain has its base on the ocean floor and has a height of 8000 feet. The top  $\frac{1}{8}$  of the volume of the mountain is above water. What is the depth of the ocean at the base of the mountain, in feet?
5. A sphere of radius is inscribed in a cone with a base of 6. What is the height of the cone? What is the surface area (without the base) of the cone?
