1.18 Introduction to functional equations (part 3)

1. Find all functions $f: \mathbb{R} \rightarrow \mathbb{R}$ such that $f(2x) = 2f(x)$ and $|x - f(x)| \leq 1$ for all x in \mathbb{R} .
2. Identify all asymptotic behavior of the graph

$$g(x) = \frac{x^4 - x^3 + 7x^2 - x + 1}{x^3 + x}.$$

Determine, with justification, if this graph has a half-turn symmetry.

3. Determine if the following statement is true.

If $f: \mathbb{R} \rightarrow \mathbb{R}$ is a function for which $f(x+10) = f(x) + f(10)$, then f is linear.

4. Let $f(x)$ be a quadratic polynomial with real coefficients. Prove that $f(x)$ cannot be written as a sum of two periodic functions.
5. Call a real-valued function f *very convex* if

$$\frac{f(x) + f(y)}{2} \geq f\left(\frac{x+y}{2}\right) + |x-y|$$

holds for all real numbers x and y . Prove that no very convex function exists.
